What I would like to do

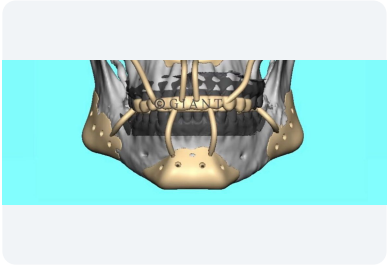

Jaw-angle implant revision, midface lift and fat grafting, and rhinoplasty.

1 Jaw-angle implant revision

I'd like to revise my jaw-angle implants because they look bulky and the right edge feels sharp. I prefer replacing both with smoother shapes that look balanced, while keeping the jaw height and corners I like. Liam's new jaw-angle design is a reference I like.

Keeping the left implant is the alternative. In that case, the new right implant would need a smoother edge and a little more width to match it.

I'd also like you to try improving muscle coverage from inside the mouth, if possible. Any outside incision or extra fat there would need a separate discussion.

Liam's new jaw design - a reference I like. Full image on the board.

2 Midface lift and fat grafting

I'd like the tissue over my infraorbital implants to sit a little higher and the contour to look smoother. We discussed keeping these implants and lifting the tissue through the lower eyelid, with a small temple lift. Cömert was unsure how much this would hide the existing implant shape.

I'd like to discuss small amounts of fat around the upper and lower eyes to soften the hollow areas. On the call, the idea was to lift and secure the tissue, then only add a little fat if the coverage was not enough.

> **One detail on the left:** the previous lateral orbital implant surgery left a bump with a visible line over it. If it can be reached through the same lower-eyelid incision, I'd like to discuss smoothing it. A small bone graft was one idea I wanted to ask about.
>
> **One small addition:** please also consider a small fat graft beside the RIGHT nostril base. The amount would be decided after examining the area.

3 Rhinoplasty

I'd like my nose to look straighter and more symmetrical, and I want to breathe better. One side collapses when I breathe. That is also the side where I feel the bridge needs more support, even though it looks bony. I'd like the septum, nasal valve and sidewall checked as part of the plan.

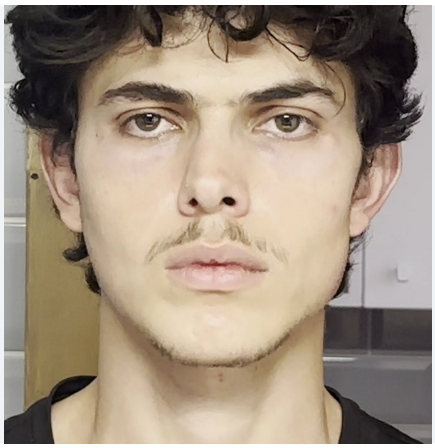

I like my side profile and current tip rotation, so I'd like to keep that overall look. The edits show ideas to discuss, rather than a final nose design.

Optional: otoplasty (small ear pinning).

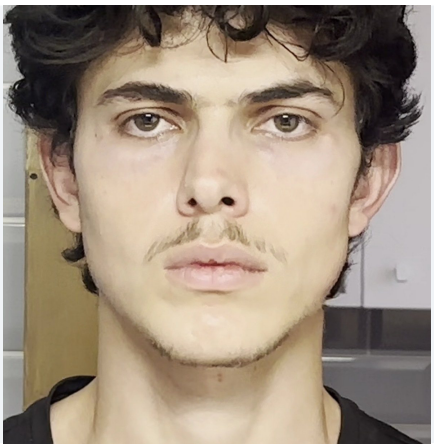

Visual references & files

These photo edits show ideas to discuss. They do not predict the result of surgery.

Jaw / current

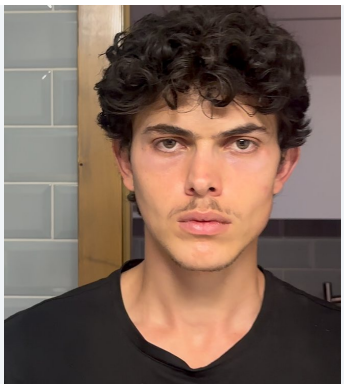

Jaw / B width illustration

This edit makes the right a little wider and the left narrower. Trial inputs: right +2 mm above the corner / +1 mm at it; left up to ~2.8 mm inward, with no upward movement. These are rough photo-edit numbers, not implant sizes. This edit does not use Liam's new design.

Nose / current

Nose / V1 alignment reference

V1 shows an alignment idea; it is not a final choice. There are no reliable millimetre measurements for this edit. Other views and nostril options are on the board. Photos cannot show how well I breathe.

Scans & full studies

Check implant position, fit and overlay alignment from the original CTs. Muscle and tissue outlines do not prove attachment or fat-pad sagging. The 2022 scan is before the infraorbital implants.

The design team needs its own CT models and plan. Original manufacturer CAD is separate. Liam's cleaned scan may help. Numbers on photo edits are trial inputs unless marked as measurements.

Board: jaw, eyes, nose, skull overlays, masseter and tissue studies
