Planning considerations

What I would like to discuss, with pictures and links to the scans.

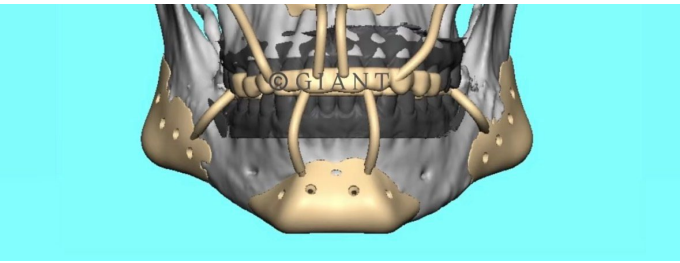

Jaw revision

I prefer replacing both jaw-angle implants. They look bulky. I want smoother corners without losing the jaw height I like. Please compare this with keeping the left implant.

Design reference: I like Liam's **new jaw-angle design**.

Other option: keep the left implant and replace only the right. Make the right smoother and a little wider to match the misplaced left side.

I would prefer trying to repair the muscle coverage from inside the mouth. Discuss an outside incision or fat graft separately.

Liam's NEW yellow/gold proposal - jaw-area crop. Original image on the board; final STL / STEP not supplied.

Small fat graft beside the nose

Consider a **small fat graft beside the RIGHT nostril base**. Check the area in person before deciding how much, if any, to use.

Relevant history

December 2021: wraparound implant. December 2022: current jaw/chin and infraorbital implants. July 2023: postoperative CT. July 2026: masseter Botox.

Midface lift & fat

We discussed a midface lift through the lower eyelid and a small temple lift, keeping the current infraorbital implants. Cömert was unsure how much this would improve the contour. The implant shape may still show. Discuss how the tissues would be held up, where fat might help, and whether implant replacement could still be needed.

LEFT outer-eye line

The previous lateral orbital implant surgery left a bump, and I can see a line over it. Please check whether it can be smoothed through the lower-eyelid incision planned for the lift. I wondered whether a small bone graft could help.

The upper- and lower-eye edits show separate ideas. They do not show a measured amount of fat.

Rhinoplasty

Keep the profile and tip rotation I like. Improve the asymmetry. I dislike V3 and V4; keep them as examples for discussion.

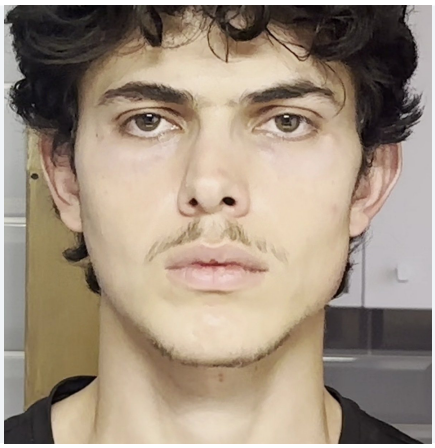

Breathing: improve nasal breathing and the collapse I get on one side. Please confirm the side and check the nasal valve, septum and sidewall. This is also the side where I feel the bridge needs more support, even though it looks bony.

Visual references & files

These photo edits show ideas to discuss. They do not predict the result of surgery.

Jaw / current

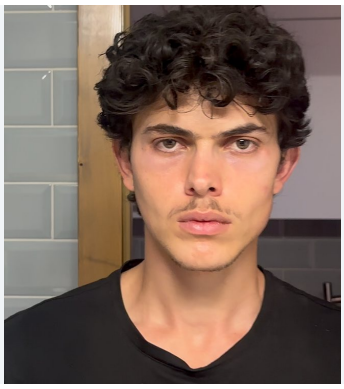

Jaw / B width illustration

This edit makes the right a little wider and the left narrower. Trial inputs: right +2 mm above the corner / +1 mm at it; left up to ~2.8 mm inward, with no upward movement. These are rough photo-edit numbers, not implant sizes. This edit does not use Liam's new design.

Nose / current

Nose / V1 alignment reference

V1 shows an alignment idea; it is not a final choice. There are no reliable millimetre measurements for this edit. Other views and nostril options are on the board. V3/V4 show changes I dislike. Photos cannot show how well I breathe.

Scans & full studies

Check implant position, fit and overlay alignment from the original CTs. Muscle and tissue outlines do not prove attachment or fat-pad sagging. The 2022 scan is before the infraorbital implants.

The design team needs its own CT models and plan. Original manufacturer CAD is separate. Liam's cleaned scan may help. Numbers on photo edits are trial inputs unless marked as measurements.

Board: jaw, eyes, nose, skull overlays, masseter and tissue studies
